Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents cDNA encoding a vanadium bromoperoxidase from species of Fucus. This enzyme is 73.4 kD in mass and catalyses the coxidation of o-dianisatione (ODA) when complexed with a vanadium ion. The cDNA encoding the enzyme was isolated from a Fucus 2-cell embryo CDNA ilbrary using hybridisation probes (AAA10306-A10307) corresponding to the second and third regions that are conserved between Curvularia and Ascophyllum vanadium haloperoxidase active sites. Fucus vanadium Correct foloned into the pET LIC (ligation independent cloning) vector for cloned into the pET LIC (ligation independent cloning) vector for correct folding. The Fucus vanadium bromoperoxidase proteins were expressed fused to an N-terminal thioredoxin tag which optimises correct folding. The Fucus vanadium bromoperoxidase proteins correct folding. The Fucus vanadium bromoperoxidase proteins for which at least partial sequences have been reported. Vanadium chaloperoxidases can be used in a method for enzymatically halogenating a compound. They can be used to halogenate various substances, including proteins. They can be used to produce epoxides from alkenes and alkymes, to produce alpha, gamma-halohydrins from cyclopropanes, and to produce dihalogenated products from alkenes and alkymes. Vanadium chaloperoxidases may also be used to oxidise various compounds, making then useful in signal generating systems in place of horseradish correct contracts.
                                                                                                    Fucus vanadium bromoperoxidase polypeptide and coding sequence, useful for halogenating or oxidizing compounds, e.g. as antibacterial agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   agents and in the production of phenolic adhesives

The invention relates to nucleic acid encoding vanadium haloperoxidase particularly vanadium bromoperoxidase polypeptide which consists of a catalytic helical frame that complexes a vanadium ion and catalyses the catalytic helical frame that complexes a vanadium ion and catalyses the coxidation of o-diamisidine (ODA). The invention also provides to convent or an befused to other proteins to allow quantification or invention can be fused to other proteins to allow quantification or localisation of the linked protein. They can be used to halogenate various substrates including proteins; to produce epoxides from alkenes, control of produce dihalogenated products from alkenes and to produce dihalogenated products from alkenes and law, and so be used in signal generating systems in place of alkynes. They can also be used in signal generating systems in place of antimicrobial agents; and in the production of phenolic adhesives. The polypeptides can be used in industrial catalysis in a variety of contexts, e.g. catalyst for halogenation, oxidation, and epoxidation reactions. The present sequence is Fucus distiches vanadium creactions. The present sequence is Fucus distiches vanadium correct OS haloperoxidase encoding cDNA. (Updated on 07-AUG-2003 to correct OS

The present sequence is Corallina officinalis (marine red algae) vanadium bromoperoxidase (CVBPO) cDNA. The vanadium haloperoxidase (expecially vanadium bromoperoxidase (UBPO) is useful for signal generation in analytical systems, and as anti-microbial agents. The VBPO is also useful for industrial applications. The VBPO is also useful for detecting a variety of chemical and biological materials such as amino acids, and antigenic proteins, carbohydrates including enzymes, avidin, antibodies and antigenic proteins, carbohydrates including monosaccharides, polyapetides than a polyaperoxides, polyapetides and lipopolysaccharides, normones such as human chorionic gonadotropin, thyroid stimulating hormone, luteinising hormone, thyroxine, follicle stimulating hormone, parathyroid hormone and growth hormone, metabolites such as glucose, lactate and pyruvate, oligonucleotides, nucleic acids, vitamins such as Bl2 and biotin, intact cells from various organisms including microorganisms and drugs such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlnAsn-------ProAsnAsnGluValThrTyrLeuLeuProGlnAlaIle 89
                                                                                                                             This cDNA encodes a haloperoxidase enzyme. The haloperoxidase genes encoding the enzymes CP.BP01 and CP.BP02 are isolated from Corallina pilulifera. A host cell transformed with a vector containing the haloperoxidase genes can be used for the recombinant production of the enzyme. The haloperoxidases of the invention are vanadium-dependent and have halide specificity of bromine and iodine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ArgalaSerCysTyrGlnLysTrpGlnValHisArgPheAlaArgProGluAlaLeuGly

                                                                                                                                                                                                                                                                                                                                                                                            encoding the enzymes CP.BP01 and CP.BP02 are isolated from Corallina pilulifera. A host cell transformed with a vector containing the haloperoxidase genes can be used for the recombinant production of the enzyme. The haloperoxidases of the invention are vanadium-dependent and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention fraintes to an isolated mucleur acts comprising any one or the invention fraintes to an isolated mucleur acts comprising a promoter operation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular continued that influences the activity of the proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway to required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic for proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation of incontents of the strains or for screening homologous nucleic acids are useful actional drug discovery programs, or for screening homologous nucleic acids required acids.

The present sequence encodes toluene monocoxygenase enzymes Tomk, TomL, TomM, TomO, TomP and TomQ. The enzymes oxidise toluene to orthosersel and 3-methylcatechol. The toluene monocoxygenase has a high efficiency in degrading aromatic and volatile oxganic chlorinated compounds. The nucleic acids are useful for the recombinant production of toluene monocoxygenase. Toluene monocoxygenase is useful for degrading a chlorinated aliphatic hydrocarbon compound (e.g. trichloroethylene (TCE) or dichloroethylene (DCE)), or an aromatic compound (e.g. toluene, sonzene, phenol, and cresol), e.g. in environmental remediation. It is especially useful for purifying air polluted with chlorinated aliphatic hydrocarbon compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel DNA fragment encoding a toluene monooxygenase, useful for degrading a chlorinated aliphatic hydrocarbon compound, or an aromatic compound, e.g. in environmental remediation.
                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2000-306010/27.

The invention relates to a vanadium bromoperoxidase (AAY87469) from species of Fucus, and to CDNA encoding it (AAA10305). This enzyme is 73.4 kD in mass and catalyses the oxidation of odianisidine (DDA) when complexed with a vanadium ion. The CDNA encoding the enzyme was isolated from a Fucus 2-cell embryo CDNA library using hybridisation probes (AAA10306- AAA10307) corresponding to the second and third regions that
                                                                                                                                  Vanadium bromoperoxidase; vanadium haloperoxidase; alga; ODA; o-dianisidine oxidation; vanadium ion; halogenation; antimicrobial agent; phenolic adhesive production; hybridisation probe; ss.
                                                                                                          Curvularia/Ascophyllum vanadium haloperoxidase conserved region 2 probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fucus vanadium bromoperoxidase polypeptide and coding sequence, useful for halogenating or oxidizing compounds, e.g. as antibacterial agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; Page 20; 46pp; English

are conserved between Curvularia and Ascophyllum vanadium haloperoxidase active sites. Fucus vanadium bromoperoxidase cDNAs (one full-length, two 5 - truncated) were then cloned into the pET LiC (ligation independent cloning) vector for expression in Escherichia coli. The vanadium bromoperoxidase proteins were expressed fused to an N-terminal bromoperoxidase proteins were expressed fused to an N-terminal bromoperoxidase has a specific activity several-fold higher than other algal vanadium haloperoxidases for which at least partial sequences have been reported. Vanadium haloperoxidases can be used in a method for enzymatically halogenating a compound, and in a method for enzymatically coxidising a compound. They can be used to halogenate various substances, including proteins. They can be used to halogenate various substances, confounding proteins. They can be used to produce alpha, gamma-halohydrins from cyclopropanes, and to produce dihalogenated products from alkenes and alkymes. Vanadium haloperoxidases may also be used to oxidise various compounds, making them useful in signal generating systems in place of horseradish peroxidase. The enzymes can also be used as enzymatic compounds and in the production of phenolic adhesives. The present sequence represents a hybridisation probe corresponding to the second region of conservation between the active sites of Curvularia in a meaning conservations the deciral active sites of Curvularia. bromoperoxidase, which was used in the isolation of cDNA encoding Fucus vanadium bromoperoxidase. (Updated on 06-AUG-2003 to correct OS field.)

```
The invention relates to nucleic acid encoding vanadium haloperoxidase particularly vanadium bromoperoxidase polypeptide which consists of a catalytic helical frame that complexes a vanadium ion and catalyses the oxidation of o-diamisidine (ODA). The invention also provides recombinantly produced vanadium haloperoxidases. The polypeptides of the invention can be fused to other proteins to allow quantification or nor localisation of the linked protein. They can be used to halogenate various substrates including proteins; to produce epoxides from alkenes, and alogenated ketones from alkenes; to produce epoxides from alkenes from cyclopropanes and to produce dialogenated products from alkenes; or alkynes. They can also be used in signal generating systems in place of alkynes. They can also be used in signal generating systems in place of contexts, e.g. catalyst for halogenation, oxidation, and epoxidation reactions. The present sequence is a probe used for cloning fourier sequence is a probe used for cloning fourier catalysis contexts, e.g. catalyst for halogenation, oxidation, and epoxidation reactions. The present sequence is a probe used for cloning fourier and the second conserved regions between Ascophyllum sp. and Curvularia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclododecanone; degradation; lauryl lactone esterase; cddA; cddB; cdd dodecanoic diacid; cyclododecanone monooxygenase; cyclic ketone; cddY; 12-hydroxylauric acid dehydrogenase; 12-oxo lauric acid dehydrogenase; macrolactone; microbiological; cddC; cddD; ds.

The invention relates to genes from Rhodococcus ruber involved in cyclododecanone degradation pathway. A 10 kb cluster from R. ruber was isolated that comprises genes (designated cddA, cddB, cddY, cddY, cddC and cddD) encoding enzymes such as dodecanoic diacid synthesizing enzyme, cyclododecanone monooxygenase, lauryl lactone esterase, 12-hydroxylauric acid dehydrogenase. Host cells comprising the nucleic acids are used for the production of dodecanedioic acid when contacted with cyclododecanone, lauryl lactone when contacted with cyclododecanone, lauryl lactone when contacted and cacid when contacted with lauryl lactone, 12-oxo lauric acid when contacted with lauryl lactone, 12-oxo lauric acid when contacted with 12-oxo lauric acid in a lactone, lactone, lactone, conduction of hydroxy acids when contacted with a cacid and cdecanone, cycloc ketones, cyclohexanone, cyclopentadecanone, cycloundecanone, cyclo dodecanone, cyclochexanone and cyclopentadecanone. The host cells are also used for the production of macrolactones with at least 10 carbon aroms when contacted with a cyclic ketone. The nucleic acids are useful for the bioproduction of daecanoic ciacid from cyclododecanone by microbiological means. The present sequence represents the nucleotide acids are useful contacted with a cyclic ketone represents the nucleotide acids are useful contacted with a cyclic ketone represents the nucleotide acids are useful contacted with a cyclic ketone represents the nucleotide acids are useful contacted with a cyclic ketone represents the nucleotide acids are useful contacted with a cyclic ketone represents the nucleotide acids are useful contacted with a cyclic decomponence represents the nucleotide acids are useful contacted with a cyclic decomponence represents the nucleotide acids are useful contacted with a cyclic decomponence represents the nucleotide acids are useful contacted with a cyclic decomponence represents the nucleotide acids are useful contacted with a cyclic decomponence represents the nucleotide acids ar

The invention relates to genes from Rhodococcus ruber involved in cyclododecanone degradation pathway. A 10 kb cluster from R. ruber was cyclododecanone degradation pathway. A 10 kb cluster from R. ruber was cyclododecanone comprises genes (designated cddA, cddB, cddY, cddX, cddY, cddC, cddC, and cddD) encoding enzymes such as dodecanoic diacid synthesizing enzyme, cyclododecanone monooxygenase, lauryl lactone esterase, 12-hydroxylauric comprising the nucleic acids are used for the production of dodecanedioic acid when contacted with 12-hydroxy lauryl clactone, 12-oxo lauric acid when contacted with lauryl lactone, 12-oxo lauric acid when contacted with lauryl clactone, 12-oxo lauric acid when contacted with lauryl cromes with 6 to eight carbon atoms like Cf, Cl0, Cl1, Cl2, Cl3 and Cl5 cyclic ketones with 6 to eight carbon atoms like Cf, Cl0, Cl1, Cl2, Cl3 and Cl5 cyclic ketones, cyclohexanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone, cyclodecanone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     87
                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

AAF81741 to AAF81777 encode the human membrane associated proteins

(MEMAP) given in AAB74695 to AAB74731. MEMAPS have cytostatic,

antiniflammatory, anticonvollabant, immunosuppressive, antidiarnheic and

antiarteriosoclerotic activities, which can be used in gene therapy.

MEMAPS and agonist of MEMAPS can be used to treat a disease or condition

Sesociated with decreased expression of functional MEMAP and antagonists

of MEMAP are used to treat a disease or condition associated with

coverexpression of functional MEMAP. These disorders include cell

coverexpression of functional MEMAP. These disorders include cell

coverexpression of functional MEMAP. These disorders and gastrointestinal

clisorders. The MEMAP polyuuclectides and proteins are also used for the

disorders. Inflammation, atherosclerosis, epilepsy and diarrhoea.

MEMAP proteins can be used to screen for compounds which specifically

bind MEMAP proteins antibodies, oligonuclectides, proteins and small

colecules. MEMAP polyuuclectides can be used to prepare transgenic

animals which can be studied to provide information concerning human

disease. Anti-MEMAP antibodies are useful in immunoassays for the

canimals which memAP protein and can be used as antagonists to treat or

prevent a disorder associated with MEMAP. Polynuclectides encoding MEMAP

can be delivered to target cells with genetic abnormalities with respect

wears, Isolated polypeptide with a human membrane associated protein sequence is useful for the diagnosis, prevention and treatment of cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders. Claim 5; Page 159-160; 173pp; English

Sequence 2117 BP; 339 A; 731 C; 672 G; 375 T; 0 U; 0 Other;
